Areas Of Improvement :-

1.Node class can be made more generic to support di
fferent datatypes.
2.Presently the algorithm assumes that start point
 is 0,0 and end point row length - 1 and column le
ngth -1 ,this can be made more dynamic as to
start point and end point can be taken at run time.

3.Any better algorithm can be tried out to make the
 program more run faster.
